

# COVID-19 WEBMAP

**Kleanthis Karavangelas**

**Liam Shamir**

**Dan Dunkers**

**Karanveer Singh**

**Dan Drzewicki**

# AGENDA

1. Introduction
2. Strategy
3. Architecture
4. Stack
5. Demonstration
6. Future work
7. References

# BACKGROUND INFO

- Covid-19 is caused by Sars-Cov-2 and responsible for coronavirus pandemic [1]
- Reported first in Wuhan, China. More than 6.4 million cases reported up until now [2]
- Classic methods of studying virus evolution:
  - Sequence alignment
  - Phylogenetic trees [3]
  - Reference sequences [4]

# ISMS- INFORMATIVE SUBTYPE MARKERS [5]

- ❑ Framework for genetic subtyping
- ❑ Allows the subtyping of individual virus genomes
- ❑ Generates a signature for easy and efficient tracking of viral evolution through geography and time

# ISM PIPELINE

# RELATED WORK

- Efforts have been made to track the spread of the virus through a website
- Dong et al. have worked with Johns Hopkins to visualize and track reported cases of COVID-19 [6]
  - However, this study does not look at subtypes
- The study that calculates the ISMs by Zhao et al. displays only static images and graphs
  - Lacks ease of use and interactivity
  - Not as accessible as a website

# STRATEGY/FRAMEWORK

- Database → MongoDB
- Front-end → JavaScript (React)
- Back-end → JavaScript (nodejs)
- Middleware → GraphQL

# SYSTEM ARCHITECTURE

# BACKEND

- Ultimately want to store json data for server-side access
  - region\_time\_series.json
  - region\_pie\_chart.json
- When a country is clicked on, graphql gets the data from the DB, processes it, and sends it to the front end
- Huge maintenance advantages
  - Scales with data size as more data becomes available
  - Loading new data is easy -> simply replace json file
  - Data is upserted so only new data needs to be saved
- Run python scripts whenever new json is available
  - Wraps 'country' key to pie chart data and 'date' key to time series data
  - Inserts into collection in db gisaid using pymongo

```
{"2019-12-24": {"Algeria": {}, "Mainland China": {"CCCCGCCACAGGTGGG": "1"},
```

```
> use gisaid
switched to db gisaid
> db.getCollection("regionTimeSeries").find({"date": /\S/}).pretty().limit(1)
{
  "_id" : ObjectId("5edd55bea3e1a26074f7bb2c"),
  "date" : "2019-12-24",
  "2019-12-24" : {
    "Algeria" : {
    },
    "Mainland China" : {
      "CCCCGCCACAGGTGGG" : "1"
    }
  },
}
```

# MIDDLEWARE

- Libraries
  - Express/GraphQL Server
- Allows easy batching of queries on client side
- Provides own test bench in development without use of external programs
- Allows client to dictate to middleware necessary information.

# FRONT-END

- Libraries
  - React
    - Allows for functional components
    - Keeping track of states
  - React simple maps
    - Interactive and customizable maps
  - Chart.js
    - Collection of charts and graphs compatible with React
  - Material UI
    - Collection of aesthetically pleasing React components
- Focus on interactivity and data visualization

# FRONT-END

- Display an interactive graph
  - Time-series data and pie chart for each country
- Color-coding
  - Give each ISM a unique color
  - Graphs and charts with that ISM will use that color
  - Color-coding same as the one on EESI GitHub
  - Allows for easier visual comparisons
  - Countries are colored according to most common ISM

DEMO

# FUTURE WORK

- Hook up the middleware and front-end
  - So that processing can be done server side
- Improve performance
  - Optimize middleware JSON parsing
- Automate ISM pipeline and integrate with web server
